PROJECT REPORT

Submitted By:

NAME: Rishika Ratnam

REG NO: 25BOE10149

BRANCH: BTECH Bioengineering

COURSE CODE: CSE0001

YEAR: 1st

INTRODUCTION

In today's world, digital technology has become a part of almost everything we do—whether it is studying, communicating, or even managing daily tasks. Because of this, having basic digital literacy is no longer optional; it is necessary. This project is based on understanding and applying different aspects of digital literacy through a series of practical and real-life tasks.

The project includes activities such as creating a digital awareness infographic, building a student portfolio on platforms like GitHub and LinkedIn, and exploring coding and collaboration tools such as Kaggle and HackerRank. These tasks helped me understand how digital platforms are not just for learning but also for showcasing skills and building a professional identity from an early stage. It also gave me a chance to try things practically instead of just reading about them in theory.

Another important part of this project was learning about digital communication and how small mistakes in online interactions can create misunderstandings. The scenario-based task made me realize that tone and clarity matter a lot while communicating through messages or emails. It showed that being respectful and clear is very important in a digital environment where expressions and emotions are not always visible.

The project also included a case study on ransomware attacks, which helped me understand the risks involved in using the internet carelessly. It was surprising to learn how a small action, like clicking on an unknown link or opening an email attachment, can lead to serious consequences such as data loss or financial damage. This part of the project made me more aware of cybersecurity and the importance of safe online behaviour.

Overall, this project was not just about completing tasks but about learning useful skills that can be applied in real life. It improved my understanding of digital tools, enhanced my awareness of online safety, and helped me develop a more responsible approach towards using technology. I believe the knowledge gained from this project will be helpful for me in my academic journey as well as in my future career.

(CREATE A DIGITAL LITERACY AWARENESS INFOGRAPHIC)

1. Tool Used

For this task, I used Canva to create my infographic. I chose it because it is simple to use and has many ready-made templates, icons, and design options. It made the whole process easier, especially since I am not very experienced with designing. At first, I selected a basic layout and then customized it according to my content and preferences that I need to work on.

2. What My Design Shows

My infographic report focuses on spreading awareness and knowledge about digital literacy among students. It includes a short explanation of what digital literacy means and why it is important in today's day to day time. I also added a section on useful digital tools like Google Docs and PowerPoint that students use regularly in their working lives.

Apart from that, I included some basic safe internet practices, such as not sharing personal information and avoiding suspicious links. I also added a small section on email etiquette, explaining how to write emails in a proper and respectful way. I tried to keep all the points short so that the information is easy to read and understand.

3. Challenges and Interesting Part

While making the infographic, the most difficult part for me was managing the content and design together. At the beginning, I added too much text, which made the infographic look crowded and messy. Then I had to remove extra information and keep only the important points.

At the same time, the interesting part was experimenting with different colours, icons, and layouts. It was fun to see how small design changes can make the infographic look more attractive and clear.

4. Conclusion

Overall, this task helped me to understand the importance of presenting information in a simple and visually appealing way. It also improved my basic design skills and made me more aware of digital literacy concepts that are useful in everyday life.

Even though it helped me to understand how much digital literacy is worth it, it made me realize to have such knowledge during this modern lifetime.

Task – 2

(BUILD YOUR STUDENT DIGITAL PORTFOLIO)

1. Platforms I Chose

For building my digital portfolio, I chose GitHub, LinkedIn, and Kaggle. I selected these because they are widely used by students and professionals, especially in technical and engineering fields. Each platform serves a different purpose, which makes my profile more complete.

2. What Each Platform is Used For

GitHub:

I will use GitHub to upload my coding projects, assignments, and practice work. It helps in showing my programming skills and consistency over time.

LinkedIn:

LinkedIn will be used to build a professional profile where I can connect with seniors, teachers, and recruiters. I can also share my achievements, internships, and certifications here.

Kaggle:

Kaggle is mainly for data-related work. I plan to use it for learning data science, participating in competitions, and improving my problem-solving skills.

3. How I Plan to Use Them Over the Next Four Years

Over the next four years, I plan to regularly update my GitHub with projects from my coursework and personal learning. On LinkedIn, I will stay active by posting updates about my achievements and connecting with people in my field. For Kaggle, I will try to participate in competitions and gradually improve my skills. I want to build a strong online presence that can help me during placements and help me to shine in company-assigned tasks.

4. Conclusion

Overall, these platforms will help me create a solid digital presence and showcase my skills. If I stay consistent, they can play an important role in my career growth and future opportunities.

Task – 3

(EXPLORE CODING & COLLABORATION PLATFORMS)

1. Platforms I Used

To complete this task, I explored GitHub, Google Forms, HackerRank, and Kaggle. I had heard about them earlier, but never really used them properly. So, I thought this was a good chance to actually try them out and understand how they work.

2. What I Built / Practised

On GitHub, I created a simple account and tried uploading a basic program file just to understand how projects are stored and shared. It was a bit confusing at first, but I slowly got the idea of repositories and uploads.

On Kaggle, I mainly explored datasets and tried to understand how people work on real-world data. I didn't do anything very advanced, but I went through some beginner notebooks and saw how data is analysed step by step. It was interesting to see how coding is used in a practical way.

In Part A, I created an account on Hacker Rank and tried solving a basic coding problem. This was my first time properly exploring the

platform, so it helped me understand how the interface works and how coding challenges are given. While solving the question, I had to use my logical thinking along with some basic Python knowledge. Even though it was a simple problem, it made me realize how important problem-solving skills are. I feel this kind of practice is helpful because it builds a strong base in coding and can be useful later for placements and interviews.

In Part B, I made a Digital Literacy Awareness Quiz using Google Forms. I included five questions, a mix of multiple-choice and short-answer, to check basic understanding of topics like online safety, responsible usage, and digital behaviour. After creating the form, I shared it and saw how the responses were automatically collected and arranged in a Google Sheet. It was interesting to see how easily data can be managed and analysed using this tool.

3. How These Tools Will Help Me Academically

I feel these platforms will be really helpful in the coming years. GitHub will allow me to keep all my projects in one place and track my progress. Kaggle can help me improve my analytical thinking and understand concepts better through practice. It also gives exposure to real-world problems, which is useful beyond just exams.

4. Conclusion

Overall, this experience and learning helped me step out of just theory and try something practical. Even though I am still a beginner, I feel more confident about using these tools in my academic journey.

TASK - 4

(SCENARIO ANALYSIS)

“WHEN ONE MESSAGE GOES WRONG”

1. The Situation

During a group project, one student shared a sarcastic message in the group chat saying, “Wow, great job finishing everything late again.”

They meant it as a joke, but the tone didn’t come across that way in text. The other teammate took it seriously and felt insulted. This led to an argument in the group, and the overall coordination was disturbed for the next few days.

2. What Actually Went Wrong

The main issue here was the lack of clarity in tone. In face-to-face conversation, sarcasm can be understood through expressions, but in text messages, it can easily be misunderstood. The message sounded rude instead of funny, which created unnecessary tension.

3. What Could Have Been Done Differently

The student could have avoided sarcasm and communicated more clearly. If there was a concern about delays, it should have been addressed politely and directly. Also, reading the message once before sending could have helped avoid confusion.

4. Conclusion

This situation shows that even small messages can create big misunderstandings online. Being clear and respectful while communicating digitally is very important to avoid such problems.

Task – 5

{ “ANALYSIS” }

What Surprised Me the Most

While researching ransomware attacks, the most surprising thing for me was how *simple and ordinary* the starting point usually is. I always imagined cyberattacks as something very technical or complex, but in reality, it often begins with just one small action—like opening an email attachment without thinking twice. It’s honestly scary to realize that such an everyday mistake can lead to something as serious as losing all data or even shutting down entire systems like hospitals or colleges.

Another thing that shocked me was how quietly the ransomware spreads. There’s no immediate warning, no visible sign at first—it just works in the background until it’s too late. That delay makes it even more dangerous because by the time people realize something is wrong, most of the damage is already done.

One Habit I Will Change

After learning all this, one habit I will definitely change is being more careful with emails and links. Earlier, I used to open attachments quickly, especially if they looked even slightly familiar or urgent. Now I understand that cybercriminals actually *depend* on this kind of human behaviour.

From now on, I will make it a rule to double-check the sender, avoid downloading unknown files, and not click on suspicious links, no matter how urgent they seem. It's a small change, but it can prevent a major problem.

Conclusion

This topic made me realize that cybersecurity is not just about software or technology—it's also about our daily habits. A little awareness and caution can make a huge difference. Even simple actions, if done carefully, can protect us from serious cyber threats like ransomware.

Conclusion

Looking back at this entire project, I feel it was not just about completing different tasks, but actually understanding how important digital literacy is in real life. Earlier, I used digital tools mostly for basic purposes like assignments or communication, without really thinking much about how to use them effectively or responsibly. But through these tasks, my perspective has definitely changed.

Each task taught me something different. Creating the infographic helped me understand how to present information simply and clearly. Building a digital portfolio made me realize the importance of starting early and being consistent if I want to stand out in the future. Exploring platforms like GitHub and Kaggle showed me that practical learning is just as important as theory. The scenario-based task made me more careful about how I communicate online, and the ransomware case study opened my eyes to the risks of careless internet usage.

One thing I clearly understood is that digital literacy is not just about knowing how to use technology; it's about using it in a smart, safe, and responsible way. Even small actions, like checking an email before opening it or thinking before sending a message, can make a big difference.

Overall, this project helped me become more aware, a bit more confident, and definitely more responsible as a digital user. I know I still have a lot to learn, but this was a good starting point. If I continue applying these learnings in my daily life, it will definitely help me in my academic journey as well as in my future career.
